Bamboo is the fastest growing wood type plant on this planet. It grows one third faster than the fastest growing tree. Some species can grow up to 1 meter per day. This growth pattern makes it easily accessible in a minimal amount of time with limited impact on the environment.

Bamboo has excellent characteristics pertaining to its hardness and durability. In addition, bamboo wallcoverings offer a unique look desired by the design community worldwide.

#### **Environmental Benefits**

- Bamboo is an environmentally sustainable grass, which replenishes itself approximately every five years. Harvesting is done over and over utilizing the same plants, minimizing the impact on the environment by only harvesting the stalk.

#### Woods

The Inami Wood designs are created through a special process, which permits one source of wood to realistically reproduce the wood grains and colors of numerous natural woods without using the authentic endangered or over-harvested species. This process minimizes waste, ensures maximum yield, and protects the natural forest woods from being depleted.

#### **Environmental Benefits**

- Preservation of natural forests and endangered species of trees: One species takes on the look of many and provides the design aesthetic of the authentic wood without endangering the natural source.
- A nearly waste-free process: The harvesting of the wood, the creation of the veneers, and the installation of the finished product are all designed to maximize yield and eliminate the enormous waste associated with harvesting and processing natural wood species.

#### Specifications

Composition:	Bamboo & Wood Veneer
Width:	36"
Length:	12 linear yard roll
Backing:	Paper backing
Fire Rating:	Class A (ASTM E-84)
Adhesive:	Roman Pro 732 – Extra strength heavy duty clay adhesive.
Finishing:	Inami Woods may be left unfinished. If a finish is required, MDC Wallcoverings recommends the use of Min-Wax Wipe On Poly. MDC advises against staining the veneer.
